Install the Autodesk SDK, which will install a run-time environment for the code. Create your own project, using the appropriate SDK and project files that come with Autodesk SDK. Link the libraries correctly, using the paths specified in the configuration file. Open your development environment and execute the code. The keygen and input modules are not needed for the sample code. Edit the project files, changing the configuration as needed. The configuration file is located in the SDK's bin\configs\ directory. Execute the application, testing that everything works correctly. You can run the application from the SDK's build directory (bin\debug etcore\x64), or from the directory you created. Create a test project. The test project should use your custom keygens. Put your keygen in a folder named MyKeygens, and then add a reference to that folder to your test project. If you want to have a keygen for each of your custom types, place them in the MyKeygens\Additions\MyKeygenName folder. Run the test project. Your keygen will be loaded and tested, and if it fails, you will get a message in your console. The test project must be set to debug. Copy the contents of the SDK's bin\debug etcore\x64\debug\Microsoft.Win32.RegistryKey*. * files to a directory on your hard drive, that you can use to generate the missing keys. Create a batch file with a for loop that loops through the files and runs the application. Specify the path to the executable with the x64 parameter, the path to your test project (specified in the line before the for loop), and the path to the directory you copied the keys from in the batch file. Save the batch file in the same directory as the application, and execute it. Software development Autocad There are a number of different keys that must be generated, and there are several possibilities for generating them. The simplest method is to use the Autocad Keygen that is installed with the Autocad SDK. However, this method works only when Autocad is installed and activated. The Autocad SDK can be used to build a custom project, but if you do so, you need to create your own key generator. SDK If you are developing with the SDK, you must link to the appropriate library.
