The Eraser allows you to remove unwanted pixels from an image. The pixels can be removed in one of two ways: you can use the Quick Selection tool to select areas of the image that you want to remove, or you can use the Eraser tool to select pixels manually. You can use the Refine Edge tool to edit the edge of an image. Paint brushes, in Photoshop CS2, work in much the same way as they did in earlier versions of the program. They allow you to paint on a layer, and can easily be used to create highly advanced effects. The History Brush allows you to paint on any area of a layer without affecting other areas of the layer. With this tool, it is easy to create layer effects. The Vectors Brush allows you to add text to an image. The text can be added anywhere on the image. However, this tool does not allow you to place the text into a specific position. The Watercolor Brush, Watercolor Bucket, and Watercolor Bucket Tool allow you to paint with the look and feel of watercolor. The Radial Blur Brush lets you blur the colors around the edge of a layer. To use this tool, simply select the area where the blur should go. The blur is applied to the selected area, then the tool is released. The Gradient tool gives you a way to paint with a gradient of colors. The gradient is used to create many types of special effects. The default gradient is a vertical gradient, but you can create horizontal, and even radial gradients. The Gradient tool also allows you to create a gradient from one point on an object to another. This can be useful for creating gradients from one area of an object to another. The Smudge tool is one of the most powerful tools in Photoshop. The Eraser tool and Dodge tool are used to soften an image. The Eraser tool also works like the Quick Selection tool. When a pixel is selected, the Eraser tool can remove the pixel or pixels and replace them with other pixels from the image. The Smudge tool is just like the Dodge tool, but it is used to soften areas of an image. The Expand tool is used to increase the size of an image. This tool does not work in the same way that you would expect. The size of an object is not usually increased. Instead, the image resizes itself to fit the new dimensions

Aiming at improving the security and privacy of your communication, Block.one has officially revealed the beta for its Extrapay protocol. Throughout the year, the number of cryptocurrencies on the market has become constantly growing, and due to that, their security and privacy deficiencies are also on the rise. As most of them are built on blockchain, those issues are particularly manifested there, and we can't help but notice them. Possessing an identical problem, Extrapay is one of the blockchain-based projects, trying to solve it. The sole difference between Extrapay and other competitors is the use of the InterPlanetary File System (IPFS). Its creator, Mathias Ahlmann, claims that IPFS can offer extra security against data decryption and access to files as well as requests such as password brute forcing. In its purpose, Extrapay aims to allow the common user to send and receive messages, make payments and maintain a decentralized file system, without the need of a centralized third-party service. Indeed, only when the user sends the funds to the corresponding address, the data are distributed across the network. Moreover, Extrapay is fully open source, and anyone can check the source code. The beta version release of Extrapay is available for both Mac and Linux. Since it is a Proof of Concept (PoC), it's not official. However, one can use this opportunity to test the new protocol and to discover its capabilities. To track the progress of the project, we suggest following the details of the Extrapay Twitter account and watching the progress of their GitHub repository. The release of the mainnet is planned for Q1 of this year. Do you think Extrapay's conception is viable, and will it help to improve the security and privacy in the crypto space?
