1. What is Photoshop? Photoshop is a photo-editing tool used by designers and

photographers to create new images. It is also one of the most used graphics editing and editing softwares on the Internet, with over 47 million active users. 2. Photoshop's

Features The Adobe

How to Utilize Your Oracle 11g Database for Disaster Recovery Making full use of Oracle 11g Database for Disaster Recovery (DR) is a best practice in today's information technology (IT) landscape. As business processes have become highly automated with the use of electronic data exchange methods, information technology systems have become integrated. IT users depend on the IT systems for their business processes and their operations also require critical business processes

to run smoothly. When business systems become problematic, key processes are often disrupted and downtime occurs. Typically, the downtime is often caused by a power outage or by a local area network (LAN) interruption. In addition, flooding from natural disasters and terrorist attacks are a common causes of disruption. Companies and organizations can reduce the impact of such disruptions by using DR technology. Disaster Recovery can enable a business to continue operating when a business system or data are

lost or inaccessible. The capability of a disaster recovery solution is critical, especially if an organization has a multi-site design (covering several sites). Downtime due to data loss could be prevented or at least minimized if the organization has a well-designed DR solution in place. How is DR implemented? Database technology is one of the most important components of DR. Recovery from local data loss can be accomplished by using hardware-based or software-based disaster recovery solutions. Hardware-based

solutions do not require any software; they are primarily embedded or built into the system that is to be protected (e.g., server and storage, network, and applications). Hardware-based solutions are highly cost-effective.

Unfortunately, such solutions are unable to manage more than two sites of data in a single configuration; i.e., it is not possible to change the configuration of the hardware-based solutions when a site is added.

Software-based solutions are more flexible than hardware-based solutions; they are

user-friendly, and they are cost-effective and user-friendly. Software-based solutions allow for disaster recovery to any number of database sites in the organization. For example, adding a site to an Oracle database organization can be done using the Oracle Express Edition. The details of Oracle Express Edition are described here.

Disaster Recovery Plans are Key

The three main elements of any disaster recovery plan are a business impact analysis, a recovery plan, and a test plan.

Business Impact Analysis:

A business impact analysis identifies the

business objectives and critical processes that need to be protected from downtime. It also identifies

A comparison of clinical efficacy and treatment times of endodontic adhesives in vitro and in vivo. The purpose of this study was to evaluate the shear bond strengths and efficacy of two adhesive resins used in the clinical management of endodontic lesions. The hypothesis was tested that the two materials had a different rate of re-treatability. Forty human maxillary premolars and

molars with moderately mature apices were collected. Teeth were sectioned, fixed in acrylic and stored in normal saline. Root canals were instrumented to a size 50 K-file, filled with either AH-26 or Prime & Bond NT, and placed within an envelope. Teeth were mounted within a jig. Each endodontic material was reapplied to the envelope with a resin point tip. Shear bond strengths were determined using an Instron testing machine. At each time period (post-operative, 6 and 12 weeks), teeth were sectioned and reevaluated

for clinical success, defined as no clinical symptoms and no radiographic evidence of progression of periapical lesions. Twelve teeth from the AH-26 group and 20 teeth from the Prime & Bond NT group were observed for 12 weeks. After 6 months, 13 teeth from the AH-26 group and 13 teeth from the Prime & Bond NT group were examined for 12 weeks. The mean shear bond strengths of AH-26 and Prime & Bond NT at postoperative, 6 and 12 weeks were 11.8 +/- 2.6 MPa, 8.9 +/- 3.0 MPa and 8.3 +/- 3.1 MPa, and 11.2 +/- 3.1 MPa and 9.6 +/- 3.4 MPa, respectively. There was no

statistically significant difference in shear bond strengths between both materials at any time period. The time required for clinical success was significantly lower for the AH-26 group (1.37 +/- 0.97 weeks) compared to the Prime & Bond NT group (1.97 +/- 0.89 weeks). There was a statistically significant difference between clinical success rates for both groups. When compared, the two materials had similar results in shear bond strengths and clinical re-treatability. However, the time required to achieve clinical success was

significantly less for AH-26 than Prime & Bond NT. April 16, 2015, Singapore - The government of Singapore has announced the launch of the world's first hospitality exchange for blockchain based assets. The initiative is based on the Interledger
