Unfortunately for her, she is pretty much at the very beginning stages of using AutoCAD and not able to do much more than simple drawing from measurements. She does however really enjoy it and would probably like to continue using it as a hobby if she had time to devote to it. Unfortunately, she is very busy with school and her work. She has a computer with AutoCAD on it, and it's been years since I helped her with anything. I'm not sure what she'd do with me right now... fongruPost 6 @teachergod1: I've never actually used AutoCAD, but I understand that it is a popular and widely used tool for CAD. I was thinking about it last night as I was trying to plan my holiday. If I had to use a 2D drafting program, it would probably be the one I found on the programs page. I'm sure there are many others out there. My computer's printer isn't the fastest, but I'm sure I could get something decent out of it. teachergod1Post 5 @gmat789: That's why I think the general public really has a hard time with AutoCAD, or any other CAD program for that matter. When you get a job in that kind of environment, there's only a certain amount of people who really understand the concepts, and what it is that you need to use it for. AutoCAD has been around a long time, and I think it has more than justified its costs of ownership. If you're buying it for a hobby, it's probably not worth it, and you'll get something just as good for not too much money.

I tried google it, but i get the most precise route between start and end point by using Router.get(route_options, callback) How can i get the most precise route between two points which is one time start and one time end? A: This solution was inspired by @niandusi's idea. It is the most precise route between start and end points. import arpspoof arpspoof.get_sketch(start_point, end_point) Here is a sample solution : >>> import numpy as np >>> from arpspoof import get_sketch >>> start_point = (34.798978, 40.684144) >>> end_point = (34.798978, 40.684144) >>> get_sketch(start_point, end_point) [{ 'arrival': { 'lat': 40.684144, 'lon': 34.798978, 'speed': 12.000, 'time': '2016-03-24T13:40:23Z' }, 'destination': { 'lat': 40.684144, 'lon': 34 ca3bfb1094

To assess the content and construct validity of a new disease-specific questionnaire, the Short-Form 36 (SF-36), in a sample of patients with advanced cancer. A postal survey was carried out with patients attending a tertiary oncology centre. Patients completed a core questionnaire that included the SF-36, and additional questions on socio-demographic information, medical history and quality of life (QOL). The SF-36 was evaluated for its content validity, and its construct validity was tested against the Cancer Treatment Satisfaction Questionnaire (CTSQ) and the Maudsley Occurrence and Severity Scale (MOSS). To assess convergent and divergent validity, correlation analyses were carried out between the SF-36 and the CTSQ, and between the SF-36 and the MOSS. Spearman's rank correlation coefficient (rs) was calculated between the SF-36 scales. Internal consistency was estimated using Cronbach's alpha. There were 400 completed questionnaires (response rate 83%). On the basis of the known-groups validity test, the SF-36 was judged to be adequate for measuring QOL in this sample of patients with advanced cancer. The scales most affected by cancer and its treatment were Physical Functioning, Role Physical, Role Emotional and Vitality, while the Mental Health scale was most affected by age and level of education. No significant correlation was found between the SF-36 and the MOSS. Cronbach's alpha values were high for all scales, ranging from 0.78 to 0.91. The SF-36 scales are brief, easy to administer and interpret, and were judged to be valid and reliable measures of QOL in this sample of patients with advanced cancer.Georgia Tech WR Devin Fuller gave some Twitter cred to the Buckeyes' staff with this fantastic throwback...
