A minimal plugin for the Abaqus FEAProduced by the ORYX group Features: The plugin has only one input parameter: - material: physical or pure By checking this box, the user is setting the material's type. Setting this parameter changes the material section's type in a matter of seconds. This is done with the help of the "materia_section" function, that is described below. There is also a "materia_bulksection" function that works exactly the same as the materia_section function, except that the bulk section's type is changed. The plugin comes with internal properties and sections for linear and nonlinear homogeneous materials and for heterogeneous and isotropic compounds and composites. Parameters: Parameters are used for running the following functions: As soon as the parameter is changed, the section types will be changed. It is recommended to always use the parameter "material", unless you know exactly what you are doing. Note: The material's type cannot be set when the plugin is created (i.e. if the user doesn't check the "material" parameter). Input parameters: The following input parameters are available: Material's type: It changes the material's section type. The default value is nonlinear if the parameter is not checked. If it is checked, the default value will be linear. Material's section type: The following section types are available: linear: Linear stress-strain analysis is performed nonlinear: Nonlinear stress-strain analysis is performed. Orthotropic: Orthotropic analysis is performed. This is used to create a simplified representation of the real materials. Heterogeneous: Heterogeneous simulation is performed. This is used to create a simplified representation of the real materials. Isotropic: Isotropic simulation is performed. This is used to create a simplified representation of the real materials. If the user doesn't want to change the section type, the material's type must be set with this parameter. CheckMaterial: This parameter is ignored. StrainRate: Strain rate is the rate at which strain is calculated by the

Is a simple and free tool to extract common materials properties from the thermo-mechanical table in an Abaqus. It works with a file similar to the one I used to make the collection that is included in this software. Please note that the materia Plugin comes in multiple file formats with different versions and formats and gives you the opportunity to modify the properties and create a new file if needed. Download: More informations: Included in this package is the Materia plugin for Abaqus, to extract parameters from a table of material properties for common materials. The plugin is free. It helps to create, edit and manage Building Information Model (BIM) information (design and

construction information) by providing integrated construction models. It supports various other features such as the ability to process BIM and AutoCAD files the ability to create and communicate via email, and a BIM. You can import architectural and engineering CAD data and projects and manage them in a BIM.
